RE: Bolton Town Barn (Site #92-1302)

Dear Ms. LaRiviere:

The Sites Management Section (SMS) has received the December 20, 1993 letter from Mike Cassara of Griffin International, Inc. regarding soil contamination at the above referenced site.

Mr. Cassara's letter indicates that the contaminated soil is restricted to an old work pit, which has concrete walls, and an assumed concrete floor. Soil in this pit was sampled and analyzed for petroleum contaminants and contained 34,000 parts per million (ppm) of total petroleum hydrocarbons.

The SMS concurs with Griffin's recommendation to excavate the contaminated soil contained in the concrete pit to be asphalt batched, providing the soil is enclosed in concrete. If during the excavation it is found that there is not a concrete floor to the pit, and groundwater is encountered, it will be necessary to determine if groundwater has been impacted by installing a monitoring well in that area. If a concrete floor is not present, additional work will be necessary to determine the degree and extent of contamination. If a concrete floor does exist, and soil is excavated and transported to be asphalt batched, a destruction certificate must be sent to the SMS, and the site will then be eligible for closure.

Please keep the SMS updated on the status of work being performed at the site, as well as forwarding a brief report following completion of the above work. If you have any questions, please feel free to call.

Sincerely,

Lynda Wedderspoon, Site Manager
Sites Management Section
